

Renewable energy

Our company's products and solutions are primarily used in the wind energy, aerospace, marine, automotive and land transportation industries thus contributing to the generation of renewable energy as well as to the reduction of fuel consumption, amongst others. As such, sustainability forms an essential part of Sinopro-Groups global business activities and sustainable growth strategy.

As one of the leading supplier in the wind turbine industry, our business core serves the promotion and growth of renewable energy. By providing competitive and innovative products, we help this industry grow and thus replace fossil fuel use faster. Sinopro would like to thank everyone around the world that has supported, assisted and shared knowledge with us to ensure Balsa the only natural, truly sustainable core material continues to have a use in the blade process.

Sustainable core materials

We support the growth of Balsa wood as a naturally grown, sustainable carbon capturing core material.
